

# Get your questions answered about MFA & Cyber Insurance

MFA is considered by DUAL Cyber to be the **#1 cybersecurity control** to protect your company from hackers.

Having MFA implemented before getting a cyber insurance quote gives you access to **more competitive rates**.

Why do I need MFA to get Cyber Insurance?

Where should MFA be implemented on my network?

As a rule of thumb, MFA should be enabled on:

- All Remote Access functions,
- All privileged user functions,
- All remotely-accessible email systems, and
- All web access, cloud services, and back-ups.

A common misconception, but no! In some cases, an **MFA solution can be implemented in as little as 1 hour**.

Some MFA providers also offer **hands-on technical assistance** with implementation experts to help you along the way.

Isn't MFA difficult to implement?

Is MFA really worth it?

Implementing MFA can in fact save you money by **lowering insurance premiums** and **protecting you from ransomware demands** as well as other costs that come with data breaches.

For more information on getting **MFA** to meet your **DUAL Cyber** requirements, visit our [page here](#).
